

Facility Profile: Aquinas Hockey Club, Perth, WA

TigerTurf: WETT (Water Efficient TigerTurf)

Aquinas Hockey Club is the first club in the western state to install the state of the art hockey surface 'TigerTurf WETT' and the club has been enjoying the new surface since April 2009.

'WETT' was developed following a new initiative by FIH (Federation of International Hockey) that called for manufacturers of synthetic surfaces to develop a playing surface which played like an international water based field without the requirement for water. TigerTurf have achieved this with 'WETT' and has FIH approval.

WETT is a unique polyethylene monofilament surface, exclusive to TigerTurf, facilitating top level hockey on a surface without water. On those occasions when players demand water, the amount is dramatically reduced when compared to nylon and polypropylene fields.

Blair Hopping, New Zealand BlackStick representative with more than 200 games say:

WETT is a vastly improved surface for the club and elite player. The ball is played truly in all directions and with the wear test and TigerTurf warranty clubs looking to install a new hockey surface should look no further.
